

NEW Sunoco E30-R

Sunoco E30-R is an advanced unleaded racing fuel containing 30% ethanol by volume. In cars that can take advantage of the higher oxygen and octane levels, Sunoco E30-R can be an effective tool for generating more power.

The recipe of Sunoco E30-R is held constant which provides a strong foundation for other performance modifications. Each batch is tested and certified to be 30% ethanol. The non-ethanol portion consists of highly refined race fuel hydrocarbons, ensuring superior stability and consistency.

This highly oxygenated fuel requires increased fuel flow compared to conventional fuels. Check with your performance tuning shop to verify that your car's fuel system can meet the increased fuel flow requirements to fully utilize the potential of Sunoco E30-R.

Technical details:

- Color: Green
- Ethanol Content: 30% (by volume)
- Oxygen Content: 10.9%
- Octane (R+M)/2: 99
- Specific Gravity: 0.755
- Typical Shelf Life: > 1 year

Applications: Modern Production Performance Engines, Drag Racing, Highly Boosted Engines

Background: Sunoco Race Fuels worked closely with nationally renowned late model performance shop Evolution Performance in Aston, PA to develop this fuel. We had been hearing some talk about racers blending their own E30 because it was the highest ethanol concentration their late model performance cars could take advantage of. We checked with Evolution Performance and they affirmed what we'd heard and asked us to develop a race fuel because there were none available and, frankly, they didn't want their customers mixing their own concoctions. We got some blends together, chose the best one, and brought it to market this summer.

Here is a link to some of Evolution's early work with E30-R:
